

### **CONCAVE, WATER -RESISTANT SURFACE**

The center of the Gatorback board is intentionally recessed 0.5" from all sides to create a pan effect that keeps retempering water and mortar on the board. The durable, water resistant surface will not absorb water from the mortar, which **INCREASES** the boardlife of mortar by as much as 20 minutes, yet significantly **DECREASES** the time laborers waste on retempering. This ensures that only good, workable mortar is used for higher jobsite production and consistent mortar properties. Excessive retempering of mortar will alter the integrity of mortar, especially colored mortar

### **INTEGRATED HANDLE**

The patent pending handle design allows masons and tenders to easily and safely carry multiple boards with one hand, at one time. This makes job site set up, and clean up, quick and efficient for mason tenders. Because they are so easy to transport, tenders will take care of this tool, especially since these boards make their job easier. To secure your Gatorbacks overnight, simply run a chain through the handles and lock **will love these boards!**

### **REINFORCED RIBBING**

The patent pending rib structure enables this mortarboard to hold as much as 150 pounds of material without flexing more than 1.5 inches and not lose its original shape. Due to their rigidity, size and strength, Gatorback boards work on steel stands, scaffold plank or on top of masonry units.
